

## 6 1 Construct Regular Polygons Geometry

Yeah, reviewing a ebook **6 1 construct regular polygons geometry** could grow your close links listings. This is just one of the solutions for you to be successful. As understood, realization does not suggest that you have wonderful points.

Comprehending as with ease as understanding even more than further will manage to pay for each success. next to, the proclamation as with ease as acuteness of this 6 1 construct regular polygons geometry can be taken as skillfully as picked to act.

Construct a regular hexagon if we know the radius of circumscribed circle. This is even easier. We just draw the circle  $c(O, r)$  and pick a starting point on it, let it be point A. In regular hexagon, we know that the radius of circumscribed circle is equal to side of polygon, meaning  $r = |AO| = |AB|$ .

Step 1, Draw a straight line using the protractor. This will be the center line of your circle (dividing it into semi-circles). Step 2, Align the protractor so that both  $0^\circ$  and  $180^\circ$  lie on the center line. Mark the center point. Step 3, Trace the semicircle along the protractor from  $0^\circ$  to  $180^\circ$ .

In mathematics, a constructible polygon is a regular polygon that can be constructed with compass and straightedge. For example, a regular pentagon is constructible with compass and straightedge while a regular heptagon is not. There are infinitely many constructible polygons, but only 31 with an odd number of sides are known.

The easiest regular polygon to construct is a hexagon. To construct a hexagon, use a compass to draw a circle. Now, (keeping the compass at the same exact setting), place the compass point on the circumference and strike an arc on the circumference. Next, place the compass point in the arc just drawn and strike another arc.

How to draw a polygon. The correct described triangle is constructed as follows (Figure 38). From the center of a given circle of radius  $R_1$  draw a circle with a radius  $R_2 = 2R_1$  and divide it into three equal parts. Division points A, B, C are the vertices of a regular triangle circumscribed around a circle of radius  $R_1$ .
