Foundations of Learning: Language, Cognition and Social Relationships The Perkins Activity and Resource Guide is a handbook for teachers and parents of students with visual and multiple disabilities. In this chapter we have combined the topics of communication, social relationships, and cognition, because it is critical that teachers think of these as integral parts of each activity and not as isolated classes to be taught at a specific time during the day. These areas must be addressed throughout the day in all activities.

This book introduces the basic concepts necessary to understand Single Event phenomena which could cause random performance errors and catastrophic failures to electronics devices. As miniaturization of electronics components advances, electronics components are more susceptible in the radiation environment. The book includes a discussion of the radiation environments in space and in the atmosphere, radiation rate prediction depending on the orbit to allow electronics engineers to design and select radiation tolerant components and systems, and single event prediction.

speech acts has been a flourishing branch of the philosophy of language and linguistics over the last two decades, and John Searle has of course himself made some of the most notable contributions to that study in the sequence of books *Speech Acts* (1969), *Expression and Meaning* (1979) and *Intentionality* (1983). In collaboration with Daniel Vanderveken he now presents the first formalised logic of a general theory of speech acts, dealing with such things as the nature of an illocutionary force, the logical form of its components, and the conditions of success of elementary illocutionary acts. The central chapters present a systematic exposition of the axioms and general laws of illocutionary logic.

This title is directed primarily towards health care professionals outside of the United States. It aims to explain how and why sensitive, holistic and evidence-based nursing care is carried out. Therefore it is relevant to students who will enter all branches of nursing and includes material that is both common to all and specific to each branch. The book aims to provide all students on foundation nursing and health care programmes with material of sufficient depth/breadth to achieve the NMC outcomes required for entry into the branch programmes. There is an emphasis not only on the theory that underpins nursing practice in the common foundation programme but also on nursing skills which form an increasingly emphasized part of the programme. The chapters have been reviewed by experts from each branch and also clinical skills to ensure the content reflects each branch accurately and appropriately. Hardly anything in psychology is as irking as the trait concept. Psychologists and laypersons alike use primarily adjective trait-names to characterize and even conceptualize the individuals they encounter. There are more than a hundred well-defined personality traits and a great many questionnaires for their assessment, some of which are designed to assess the same or very similar traits. Little is known about their ontogenetic development and even less about their underlying dynamics. Psychoanalytic theory was invoked for explaining the psychodynamics underlying a few personality traits without, however, presenting sufficient empirical evidence for the validity of these interpretations. In a reductionistic vein, behaviorally inclined psychologists have propounded the thesis that all traits are acquired behaviors. Yet, this view neither reduces the number of personality tests nor explains the resistance of traits to modification by means of reward and punishment. Dissatisfied with these and some other less well-known approaches to personality traits, we decided to explore whether applying our psychosemantic theory of cognition to the trait concept would do better. The way we had to follow was anything but easy.
