Another difference in a series circuit vs a parallel circuit is that in a parallel circuit, the voltage across all legs of the circuit is the same. It ' s the current that divides up and flows though the various elements in proportion to their value. The amount of current through each element depends on the resistance of the element.

To apply the series and parallel combination rules, it is best to first determine the circuit's structure: What is in series with what and what is in parallel with what at both small- and large-scale views. We have R_2 in parallel with R_3 ; this combination is in series with R_4 . This series combination is in parallel with R_1 .
